

Challenge 4

Testing & Performance

Exam Objectives Covered

- Select appropriate profiling tools to identify the sources of performance problems

Challenge

Testing and optimizing your code can be a difficult step when developing a project. Luckily Unity has several great tools to make both diagnosing and testing performance much easier.

In this session you are going to be fixing a new level for your game that is having some performance issues and has one script in particular that is causing issues.

Load the scene **SkiGame_Couse3_Session4_Optimization**, which is found in the Assets > Scenes folder. Play the scene and open the Stats window, then make note of the frames per second (FPS).

- ☐ The first part of this session's challenge is to use the Profiler to identify and delete the script that is causing the performance problem.
- ☐ Once that issue is fixed, enable the Snowmen group in the Hierarchy and rereview the Stats window in playmode to see how this group affects the FPS and batch calls.
- ☐ Fix the SnowmanThrow script so that you can still have a large amount of snowballs thrown without having a huge performance hit in the scene.
