

Challenge 3

Data Persistence

Exam Objectives Covered

- Save data between scenes and between sessions using approaches such as static variables and PlayerPrefs

Challenge

Persistent game data between scenes and sessions is an important feature in many Unity projects. In this session, your goal is to implement basic data persistence using the Singleton design pattern in conjunction with Unity PlayerPrefs.

Your challenge for this session is to:

- ☐ Pass a variable that stores the total number of races the player has completed between scenes by using a singleton class that also invokes DontDestroyOnLoad.
- ☐ Create a Leaderboard that stores and updates the five best times for one of the levels.
 - ☐ This data should be saved between loads of the application using PlayerPrefs.
 - ☐ When a race is over you should output the saved scores in the console window.

If you haven't worked with saving data before in Unity or need a refresher be sure to check out the support resources for this session.
